

REU Practice Problems

1 Topology and measurability

We let Σ denote a set $\llbracket p, q \rrbracket = \{p, p+1, \dots, q-1, q\}$ for $p \in \mathbb{N}$, $q \in \mathbb{N} \cup \{\infty\}$, and let Λ denote an interval in \mathbb{R} with endpoints $a \leq b$. We write $C(X)$ for the space of continuous real-valued functions on X with the topology of compact convergence and the Borel σ -algebra \mathcal{C} . Recall that this topology is generated by the basis of sets

$$B_K(f, \epsilon) := \{g \in C(X) : \sup_{x \in K} |f(x) - g(x)| < \epsilon\},$$

with $K \subset X$ is compact, $f \in C(X)$, and $\epsilon > 0$. When $X = \Sigma \times \Lambda$, we write $(C(\Sigma \times \Lambda), \mathcal{C}_\Sigma)$.

Problem 1

We aim to construct a metric $d : C(\Sigma \times \Lambda) \times C(\Sigma \times \Lambda) \rightarrow [0, \infty)$ which induces the topology of compact convergence on $C(\Sigma \times \Lambda)$. The idea is to obtain a compact exhaustion of $\Sigma \times \Lambda$, i.e., a countable collection of compact sets $K_n \subset \Sigma \times \Lambda$ such that $\bigcup_n K_n = \Sigma \times \Lambda$, and such that every compact subset of $\Sigma \times \Lambda$ is contained in some K_n . We then construct d from the sup-metrics on each of these sets K_n . We define the sets

$$K_n := \Sigma_n \times \Lambda_n = \llbracket p, q_n \rrbracket \times [a_n, b_n]$$

as follows. We let $q_n = \min(p+n, q)$. If $a \in \Lambda$, i.e., Λ is closed at the left, then $a_n = a$ for all n , and likewise $b_n = b$ if $b \in \Lambda$. If $a \notin \Lambda$, we let $a_n \in \mathbb{R}$, $a_n > a$ be a sequence decreasing to a , for instance $a_n = a + \frac{1}{n}$ if $a > -\infty$, or $a_n = -n$ if $a = -\infty$. If $b \notin \Lambda$, we let $b_n \nearrow b$. In any case, we see that the sets $K_1 \subset K_2 \subset \dots \subset \Sigma \times \Lambda$ are compact, they cover $\Sigma \times \Lambda$, and any compact subset K of $\Sigma \times \Lambda$ is contained in all K_n for sufficiently large n .

We now define, for each n and $f, g \in C(\Sigma \times \Lambda)$,

$$d_n(f, g) := \sup_{(i,t) \in K_n} |f(i, t) - g(i, t)|, \quad d'_n(f, g) := \min\{d_n(f, g), 1\}$$

Clearly each d_n is nonnegative and satisfies the triangle inequality, and it is then easy to see that the same properties hold for d'_n . Furthermore, $d'_n \leq 1$, so we can define

$$d(f, g) := \sum_{n=1}^{\infty} 2^{-n} d'_n(f, g).$$

We first observe that d is a metric on $C(\Sigma \times \Lambda)$. Indeed, it is nonnegative, and if $f = g$, then each $d'_n(f, g) = 0$, so the sum is 0. Conversely, if $f \neq g$, then since the K_n cover $\Sigma \times \Lambda$, we can choose n large enough so that K_n contains an x with $f(x) \neq g(x)$. Then $d'_n(f, g) \neq 0$, and hence $d(f, g) \neq 0$. The triangle inequality holds for d since it holds for each d'_n .

Now we prove that the topology τ_d on $C(\Sigma \times \Lambda)$ induced by d is the same as the topology of compact convergence, which we will denote τ_c . First, choose $\epsilon > 0$ and $f \in C(\Sigma \times \Lambda)$. Let $g \in B_\epsilon^d(f)$, i.e., $d(f, g) < \epsilon$. We will find a set $A_g \in \tau_c$ such that $g \in A_g \subset B_\epsilon^d(f)$. Let $\delta := d(f, g)$, and choose n large enough so that $\sum_{k>n} 2^{-k} < \frac{\epsilon - \delta}{2}$. Define $A_g := B_{K_n}(g, \frac{\epsilon - \delta}{n})$, and suppose $h \in A_g$. Then since $K_m \subseteq K_n$ for $m \leq n$, we have

$$\begin{aligned} d(f, h) &\leq d(f, g) + d(g, h) \\ &\leq \delta + \sum_{k=1}^n 2^{-k} d_n(g, h) + \sum_{k>n} 2^{-k} \\ &\leq \delta + \frac{\epsilon - \delta}{2} + \frac{\epsilon - \delta}{2} = \epsilon. \end{aligned}$$

Therefore $g \in A_g \subset B_\epsilon^d(f)$. It follows that $B_\epsilon^d(f) \in \tau_c$. Indeed, we can write

$$B_\epsilon^d(f) = \bigcup_{g \in B_\epsilon^d(f)} A_g,$$

a union of elements of τ_c . This proves that $\tau_d \subseteq \tau_c$.

To prove the converse, let $K \subset \Sigma \times \Lambda$ be compact, $f \in C(\Sigma \times \Lambda)$, and $\epsilon > 0$. Choose n so that $K \subset K_n$, and let $g \in B_K(f, \epsilon)$ and $\delta := \sup_{x \in K} |f(x) - g(x)|$. If $d(g, h) < 2^{-n}(\epsilon - \delta)$, then $d'_n(g, h) \leq 2^n d(g, h) < \epsilon - \delta$, hence $d_n(g, h) < \epsilon - \delta$. It follows that

$$\begin{aligned} \sup_{x \in K} |f(x) - h(x)| &\leq \delta + \sup_{x \in K} |g(x) - h(x)| \leq \delta + d_n(g, h) \\ &\leq \delta + \epsilon - \delta = \epsilon. \end{aligned}$$

Thus $g \in B_{2^{-n}(\epsilon - \delta)}^d(f) \subset B_K(f, \epsilon)$. It follows that $\tau_c \subseteq \tau_d$, and we conclude that $\tau_d = \tau_c$.

Next, we show that $(C(\Sigma \times \Lambda), d)$ is a complete metric space. Let $(f_n)_{n \geq 1}$ be Cauchy with respect to d . Then we claim that (f_n) must be Cauchy with respect to d'_n , on each K_n . Indeed, $d(f_\ell, f_m) \geq 2^{-n} d'_n(f_\ell, f_m)$, so if (f_n) were not Cauchy with respect to d'_n , it would not be Cauchy with respect to d either. Thus (f_n) is uniformly Cauchy on each K_n , and hence converges uniformly to a limit f^{K_n} on each K_n . Since the limit must be unique at each point of $\Sigma \times \Lambda$, we have $f^{K_n}(x) = f^{K_m}(x)$ if $x \in K_n \cap K_m$. Since $\bigcup K_n = \Sigma \times \Lambda$, we obtain a well-defined function f on all of $\Sigma \times \Lambda$ given by $f(x) = f^{K_n}(x)$, where $x \in K_n$. Given any compact $K \subset \Sigma \times \Lambda$, if n is large enough so that $K \subset K_n$, then because $f_n \rightarrow f^{K_n} = f|_{K_n}$ uniformly on K_n , we have $f_n \rightarrow f^{K_n}|_K = f|_K$ uniformly on K . That is, for any $K \subset \Sigma \times \Lambda$ compact and $\epsilon > 0$, we have $f_n \in B_K(f, \epsilon)$ for all sufficiently large n . Therefore (f_n) converges to f in the topology of compact convergence, and equivalently in the metric d .

Lastly, we prove separability, following example 1.3 in Billingsley, *Convergence of Probability Measures*. For each pair of positive integers n, k , let $D_{n,k}$ be the subcollection of $C(\Sigma \times \Lambda)$ consisting of polygonal functions that are piecewise linear on $\{j\} \times I_{n,k,i}$ for each $j \in \Sigma_n$ and each subinterval

$$I_{n,k,i} := [a_n + \frac{i-1}{k}(b_n - a_n), a_n + \frac{i}{k}(b_n - a_n)], \quad 1 \leq i \leq k,$$

taking rational values at the endpoints of these subintervals, and extended linearly to all of $\Lambda = [a, b]$. Then $D := \bigcup_{n,k} D_{n,k}$ is countable, and we claim that it is dense in the topology

of compact convergence. To see this, let $K \subset \Sigma \times \Lambda$ be compact, $f \in C(\Sigma \times \Lambda)$, and $\epsilon > 0$, and choose n so that $K \subset K_n$. Since f is uniformly continuous on K_n , we can choose k large enough so that $|f(j, t) - f(j, a_n + \frac{i}{k}(b_n - a_n))| < \epsilon/2$ for $j \in \Sigma_n$ and $1 \leq i \leq k$. We then choose $g \in \bigcup_k D_{n,k}$ with $|g(j, a_n + \frac{i}{k}(b_n - a_n)) - f(j, a_n + \frac{i}{k}(b_n - a_n))| < \epsilon/2$. Then $f(j, t)$ is within ϵ of both $g(j, a_n + \frac{i-1}{k}(b_n - a_n))$ and $g(j, a_n + \frac{i}{k}(b_n - a_n))$. Since $g(j, t)$ lies between these two values, $f(j, t)$ is within ϵ of $g(j, t)$ as well. In summary,

$$\sup_{(j,t) \in K} |f(j, t) - g(j, t)| \leq \sup_{(j,t) \in K_n} |f(j, t) - g(j, t)| < \epsilon,$$

so $g \in B_K(f, \epsilon)$. This proves that D is a countable dense subset of $C(\Sigma \times \Lambda)$. We conclude that $(C(\Sigma \times \Lambda), \tau_c)$ is a Polish space.

Problem 2

Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space and X, Y random variables on $(\Omega, \mathcal{F}, \mathbb{P})$ taking values in $C(\Sigma \times \Lambda)$, where $\Sigma = \llbracket 1, N \rrbracket$ with $N \in \mathbb{N}$ or $N = \infty$. We consider the collection \mathcal{S}_X of sets of the form

$$\{\omega \in \Omega : X(\omega)(i_1, t_1) \leq x_1, \dots, X(\omega)(i_n, t_n) \leq x_n\} = \bigcap_{k=1}^n X(i_k, t_k)^{-1}(-\infty, x_k],$$

ranging over all $n \in \mathbb{N}$, $(i_1, t_1), \dots, (i_n, t_n) \in \Sigma \times \Lambda$, and $x_1, \dots, x_n \in \mathbb{R}$. We first prove that $\mathcal{S}_X \subset \mathcal{F}$. We can write

$$\{X(i_k, t_k) \leq x_k\} = X^{-1}(\{f \in C(\Sigma \times \Lambda) : f(i_k, t_k) \leq x_k\}).$$

We claim that the set $\{f \in C(\Sigma \times \Lambda) : f(i_k, t_k) \leq x_k\}$ is closed in the topology of compact convergence. If $f_n(i_k, t_k) \leq x_k$ for all n and $f_n \rightarrow f$ in the topology of compact convergence, then by taking limits on a compact set containing (i_k, t_k) , we find $f(i_k, t_k) \leq x_k$ as well. This proves the claim, and it follows from the measurability of X that $\{X(i_k, t_k) \leq x_k\} = X^{-1}(\{f(i_k, t_k) \leq x_k\}) \in \mathcal{F}$. The finite intersection is thus also in \mathcal{F} , proving that $\mathcal{S}_X \subset \mathcal{F}$. On the other hand, it is clear that $\{\omega \in \Omega : X(\omega) \in A\} = X^{-1}(A) \in \mathcal{F}$ for any $A \in \mathcal{C}_\Sigma$ since X is measurable.

Now we prove that $\mathbb{P}|_{\mathcal{S}_X}$ determines the distribution $\mathbb{P} \circ X^{-1}$. To do so, note that $\mathcal{S}_X = \sigma(\{X^{-1}(A) : A \in \mathcal{S}\})$, where \mathcal{S} is the collection of cylinder sets

$$\{f \in C(\Sigma \times \Lambda) : f(i_1, t_1) \in A_1, \dots, f(i_n, t_n) \in A_n\}, \quad A_1, \dots, A_n \in \mathcal{B}(\mathbb{R}).$$

This follows from the fact that $\mathcal{B}(\mathbb{R})$ is generated by intervals of the form $(-\infty, x]$. Furthermore, this fact, along with the fact proven above that $\{f(i_k, t_k) \in (-\infty, x_k]\}$ is closed, show that $\mathcal{S} \subset \mathcal{C}_\Sigma$. Observe that the intersection of two elements of \mathcal{S} is clearly another element of \mathcal{S} , so \mathcal{S} is a π -system. We now argue that \mathcal{S} generates the Borel sets, i.e., $\sigma(\mathcal{S}) = \mathcal{C}_\Sigma$. Since $\mathcal{S} \subset \mathcal{C}_\Sigma$, we have $\sigma(\mathcal{S}) \subseteq \mathcal{C}_\Sigma$. To prove the opposite inclusion, let $K \subset \Sigma \times \Lambda$ be compact, $f \in C(\Sigma \times \Lambda)$, and $\epsilon > 0$, and let H be a countable dense subset of K . (Recall that every

compact metric space is separable, and K is homeomorphic to a product of finitely many compact sets in \mathbb{R} , which are metrizable. So K is separable.) We claim that

$$B_K(f, \epsilon) = \bigcup_{n=1}^{\infty} \bigcap_{(i,t) \in H} \{g \in C(\Sigma \times \Lambda) : g(i, t) \in (f(i, t) - (1 - 2^{-n})\epsilon, f(i, t) + (1 - 2^{-n})\epsilon)\}.$$

Indeed, if $g \in B_K(f, \epsilon)$, i.e., $\sup_{(i,t) \in K} |g(i, t) - f(i, t)| < \epsilon$. Then since $1 - 2^{-m} \nearrow 1$, we can choose m large enough so that

$$|g(i, t) - f(i, t)| < (1 - 2^{-n})\epsilon$$

for all $(i, t) \in K$ (in particular with $(i, t) \in H$). Conversely, suppose g is in the set on the right. Then since g is continuous and H is dense in K , we find that for some $n \geq 1$,

$$|g(i, t) - f(i, t)| \leq (1 - 2^{-n})\epsilon < \epsilon$$

for all $(i, t) \in K$. Hence $g \in B_K(f, \epsilon)$. This proves the claim. Since H is countable, $B_K(f, \epsilon)$ is formed from countably many unions and intersections of sets in \mathcal{S} , thus $B_K(f, \epsilon) \in \sigma(\mathcal{S})$.

Now by problem 1, the topology generated by the basis $\mathcal{A} = \{B_K(f, \epsilon)\}$ is separable and metrizable. The balls of rational radii centered at points of a countable dense subset then give a (different) countable basis \mathcal{B} for the same topology. We claim that this implies that every open set is a *countable* union of sets $B_K(f, \epsilon)$. To see this, let $B \in \mathcal{B}$, and write $B = \bigcup_{\alpha \in I} A_{\alpha}$, for sets $A_{\alpha} \in \mathcal{A}$. Then for each $x \in B$, pick $\alpha_x \in I$ such that $x \in A_{\alpha_x}$. Since \mathcal{B} is a basis, there is a set $B_x \in \mathcal{B}$ with $x \in B_x \subseteq A_{\alpha_x}$. Then $B = \bigcup_{x \in B} B_x$. Note that if $y \in B_y \subseteq A_{\alpha_y}$ and $B_y = B_x$, then in fact $y \in A_{\alpha_x}$, so we can remove A_{α_y} from the union. In other words, we can choose the A_{α_x} so that each corresponds to exactly one B_x . But there are only countably many distinct sets B_x , so we see that B is a countable union of elements of \mathcal{A} . Since every open set can be written as a countable union of elements of B , this proves the claim. Since $\mathcal{A} \subseteq \sigma(\mathcal{S})$ by the above, it follows that every open set is in $\sigma(\mathcal{S})$, and consequently so is every Borel set, i.e., $\mathcal{C}_{\Sigma} \subseteq \sigma(\mathcal{S})$.

In summary, we have shown that the collection \mathcal{S} is a π -system generating \mathcal{C}_{Σ} , so the probability measure $\mathbb{P} \circ X^{-1}$ on \mathcal{C}_{Σ} is uniquely determined by its restriction to \mathcal{S} . Suppose

$$\begin{aligned} \mathbb{P}(\{\omega \in \Omega : X(\omega)(i_1, t_1) \leq x_1, \dots, X(\omega)(i_n, t_n) \leq x_n\}) = \\ \mathbb{P}(\{\omega \in \Omega : Y(\omega)(i_1, t_1) \leq x_1, \dots, Y(\omega)(i_n, t_n) \leq x_n\}) \end{aligned}$$

for all $(i_1, t_1), x_1, \dots, x_n$. This says that the two probability measures $\mathbb{P} \circ X^{-1}$ and $\mathbb{P} \circ Y^{-1}$ agree on \mathcal{S} . Then they must agree on all of \mathcal{C}_{Σ} , i.e.,

$$\mathbb{P}(\{\omega \in \Omega : X(\omega) \in A\}) = \mathbb{P}(\{\omega \in \Omega : Y(\omega) \in A\})$$

for all $A \in \mathcal{C}_{\Sigma}$. In other words, the law of a line ensemble is determined by its finite dimensional distributions.

2 Algebra

Problem 3

Problem 4

3 Weak convergence

Problem 5

(1) $\phi_n(t) = \mathbb{E}[e^{itY_n}] = \sum_{k=0}^{\infty} p_n(1-p_n)^k e^{itp_n k} = \frac{p_n}{1-(1-p_n)e^{itp_n}}$. Then,

$$\lim_{n \rightarrow \infty} \phi_n(t) = \lim_{x \rightarrow 0} \frac{x}{1 - (1-x)e^{itx}} = \lim_{x \rightarrow 0} \frac{1}{1 - it(1-x)e^{itx}} \text{ (L'Hospital) } = \frac{1}{1 - it},$$

which is the characteristic function of exponential random variable with parameter 1. Therefore, Y_n weakly converges to $Z \sim \text{Exp}(1)$.

(2) Notice that

$$\begin{aligned} \frac{d}{dq_n} \mathbb{E}[Y_n^{k-1}] &= \frac{d}{dq_n} \left[\sum_{x=0}^{\infty} p_n^{k-1} x^{k-1} p_n q_n^x \right] = \sum_{x=0}^{\infty} x^{k-1} [-k p_n^{k-1} q_n^x + p_n^k x q_n^{x-1}] \\ &= -\frac{k}{p_n} \sum_{x=0}^{\infty} (p_n x)^{k-1} p_n q_n^x + \frac{1}{p_n q_n} \sum_{x=0}^{\infty} (p_n x)^k p_n q_n^x \\ &= -\frac{k}{p_n} \mathbb{E}[Y_n^{k-1}] + \frac{1}{p_n q_n} \mathbb{E}[Y_n^k] \end{aligned}$$

Therefore, we have

$$\mathbb{E}[Y_n^k] = p_n q_n \frac{d}{dq_n} \mathbb{E}[Y_n^{k-1}] + k \cdot q_n \mathbb{E}[Y_n^{k-1}]$$

Let $p_n \rightarrow 0$, we get $\lim_{n \rightarrow \infty} \mathbb{E}[Y_n^k] = k \cdot \lim_{n \rightarrow \infty} \mathbb{E}[Y_n^{k-1}]$. Since $\lim_{n \rightarrow \infty} \mathbb{E}[Y_n] = \lim_{n \rightarrow \infty} p_n \cdot \frac{1-p_n}{p_n} = 1$, we obtain:

$$\lim_{n \rightarrow \infty} \mathbb{E}[Y_n^k] = k!$$

which is the k -th moment of exponential random variable with parameter 1.

(3) For a bounded continuous function f which is bounded by M ,

$$\mathbb{E}[f(Y_n)] = \sum_{k=0}^{\infty} f(kp_n) p_n (1-p_n)^k \leq \frac{M(1-p_n)}{p_n}$$

is well-defined. Notice that $(1-p_n)^k = e^{k \ln(1-p_n)} = e^{-kp_n + o(p_n)} = e^{-kp_n} (1 + o(p_n))$, so

$$\mathbb{E}[f(Y_n)] = \sum_{k=0}^{\infty} f(kp_n) p_n e^{-kp_n} + \sum_{k=0}^{\infty} f(kp_n) p_n e^{-kp_n} o(p_n)$$

For the first term,

$$\lim_{n \rightarrow \infty} \sum_{k=0}^{\infty} f(kp_n) p_n e^{-kp_n} = \int_0^{\infty} f(x) e^{-x} dx = \mathbb{E}[f(Y)]$$

by definition of integral, and here we use the continuity of function f . For the second term, it converges to 0. Thus, $\mathbb{E}[f(Y_n)] \xrightarrow{n \rightarrow \infty} \mathbb{E}[f(Y)]$.

(4) Consider $\frac{1}{p_n} \cdot p_n(1-p_n)^{k_n}$, where $k_n = x \cdot \frac{1}{p_n}$. Notice that $\frac{1}{p_n} \cdot p_n(1-p_n)^{k_n} = e^{\frac{x}{p_n} \ln(1-p_n)} = e^{\frac{x}{p_n}(-p_n + o(p_n))} = e^{-x+o(1)}$. Consider

$$\begin{aligned} \mathbb{P}(a \leq Y_n \leq b) &= \mathbb{P}\left(\frac{a}{p_n} \leq X_n \leq \frac{b}{p_n}\right) \\ &= \sum_{k=m_n}^{M_n} \mathbb{P}(X_n = k) \quad (\text{where } m_n = \lfloor \frac{a}{p_n} \rfloor + 1, M_n = \lfloor \frac{b}{p_n} \rfloor) \\ &= \sum_{k=m_n}^{M_n} p_n e^{x_k + o(1)} \quad (\text{where } x_k = p_n k \text{ and } x_k - x_{k-1} = p_n) \\ &\approx \sum_{k=m_n}^{M_n} \int_{x_k - \frac{1}{2}p_n}^{x_k + \frac{1}{2}p_n} e^{-x} dx = \int_{x_{m_n} - \frac{1}{2}p_n}^{x_{M_n} + \frac{1}{2}p_n} e^{-x} dx \\ &\rightarrow \int_a^b e^{-x} dx \quad (\text{as } n \rightarrow \infty) \end{aligned}$$

Therefore, $\lim_{n \rightarrow \infty} \mathbb{P}(Y_n \leq x) = \int_{-\infty}^x e^{-u} du$.

Problem 6

(1)

$$\begin{aligned} \phi_n(t) &= \mathbb{E}[e^{itX_n}] = \sum_{k=0}^{N_n} \binom{N_n}{k} p_n^k (1-p_n)^{N_n-k} e^{itk} \\ &= (p_n e^{it} + (1-p_n))^{N_n} \\ &= e^{N_n \ln(1+p_n(e^{it}-1))} \end{aligned}$$

As $p_n \rightarrow 0$, $N_n \rightarrow \infty$, $p_n N_n \rightarrow \lambda$, we have $\ln(1+p_n(e^{it}-1)) \rightarrow p_n(e^{it}-1)$, and $\lim_{n \rightarrow \infty} \phi_n(t) = e^{\lim_{n \rightarrow \infty} N_n p_n (e^{it}-1)} = e^{\lambda(e^{it}-1)}$, which is the characteristic function of Poisson distribution. Thus, X_n weakly converges to Poisson random variable with parameter λ .

(2) Denote

$$P_{k,n} = \frac{N_n!}{k!(N_n-k)!} \cdot p_n^k (1-p_n)^{N_n-k} = \frac{(p_n N_n)^k}{k!} \cdot \frac{N_n!}{N_n^k (N_n-k)!} (1-p_n)^{N_n-k}$$

Notice that $\frac{N_n!}{N_n^k (N_n-k)!} = \frac{N_n}{N_n} \cdot \frac{N_n-1}{N_n} \cdot \dots \cdot \frac{N_n-k+1}{N_n} \rightarrow 1$, as $N_n \rightarrow \infty$;

$(1-p_n)^{N_n-k} = e^{(N_n-k)\ln(1-p_n)} = e^{(N_n-k)(-p_n+o(p_n))} \rightarrow e^{-\lambda}$, as $n \rightarrow \infty$;

and $\frac{(p_n N_n)^k}{k!} \rightarrow \frac{\lambda^k}{k!}$. Therefore, $P_{k,n} \rightarrow \frac{\lambda^k}{k!} e^{-\lambda}$ as $n \rightarrow \infty$. Then, $\mathbb{P}(X_n \leq x) = \sum_{k=1}^{[x]} P_{k,n}$. Let $n \rightarrow \infty$, $\mathbb{P}(X_n \leq x) = \sum_{k=1}^{[x]} P_{k,n} \rightarrow \sum_{k=1}^{[x]} \frac{\lambda^k}{k!} e^{-\lambda}$ is the distribution of Poisson random variable.

Problem 7

(1)

$$\begin{aligned}\phi_n(t) &= \mathbb{E}[e^{itY_n}] = \sum_{k=0}^{\infty} e^{-n} \frac{n^k}{k!} e^{it \frac{k-n}{\sqrt{n}}} \\ &= \sum_{k=0}^{\infty} \frac{(n e^{it \frac{1}{\sqrt{n}}})^k}{k!} e^{-it\sqrt{n}-n} \\ &= e^{-it\sqrt{n}-n+ne^{it \frac{1}{\sqrt{n}}}}\end{aligned}$$

Notice that $n(e^{it \frac{1}{\sqrt{n}}} - 1) - it\sqrt{n} = n(it \frac{1}{\sqrt{n}} + \frac{1}{2}(it \frac{1}{\sqrt{n}})^2 + o(\frac{1}{n})) - it\sqrt{n} = -\frac{1}{2}t^2 + o(1)$. Therefore, $\phi_n(t) \rightarrow e^{-\frac{1}{2}t^2}$ as $n \rightarrow \infty$, which is the characteristic function of standard normal random variable.

(2) Let us consider $\lim_{n \rightarrow \infty} \sqrt{n} \frac{n^{k_n}}{k_n!} e^{-n}$, where $k_n = x\sqrt{n} + n$. By Stirling's formula, $n! \sim \sqrt{2\pi n} n^n e^{-n}$. Then,

$$\begin{aligned}\sqrt{n} \frac{n^{k_n}}{k_n!} e^{-n} &\sim \sqrt{n} \frac{n^{k_n}}{\sqrt{2\pi k_n} k_n^{k_n} e^{-k_n}} e^{-n} \\ &= \frac{\sqrt{n}}{\sqrt{2\pi k_n}} \left(\frac{n}{k_n}\right)^{k_n} e^{k_n-n} \\ &= \frac{\sqrt{n}}{\sqrt{2\pi k_n}} e^{k_n \ln(\frac{n}{k_n}) + k_n - n}\end{aligned}$$

Notice that $k_n = x\sqrt{n} + n \sim O(n)$, we know $\lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{k_n}} = 1$;

$$\begin{aligned}k_n \ln\left(\frac{n}{k_n}\right) &= k_n \ln\left(1 - \frac{k_n - n}{k_n}\right) \quad \left(\frac{k_n - n}{k_n} = \frac{x}{x + \sqrt{n}} \sim O\left(\frac{1}{\sqrt{n}}\right)\right) \\ &= k_n \left(-\frac{k_n - n}{k_n} - \frac{1}{2}\left(\frac{k_n - n}{k_n}\right)^2 + o\left(\frac{1}{n}\right)\right) \\ &= -k_n + n - \frac{1}{2} \frac{nx^2}{x\sqrt{n} + n} + o(1) \\ &= -k_n + n - \frac{1}{2} x^2 + o(1)\end{aligned}$$

Therefore, $\sqrt{n} \frac{n^{k_n}}{k_n!} e^{-n} = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}x^2 + o(1)}$.

Next, consider: $\mathbb{P}(a \leq Y_n \leq b) = \mathbb{P}(a\sqrt{n} + n \leq X_n \leq b_n + n)$. Denote $m_n = [a\sqrt{n} + n] + 1$,

$M_n = \lfloor b\sqrt{n} + n \rfloor$, then

$$\begin{aligned}
\mathbb{P}(a \leq Y_n \leq b) &= \sum_{k=m_n}^{M_n} \mathbb{P}(X_n = k) \\
&= \sum_{k=m_n}^{M_n} \frac{1}{\sqrt{n}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x_k^2}{2} + o(1)} \quad (\text{where } x_k = \frac{k-n}{\sqrt{n}}, x_k - x_{k-1} = \frac{1}{\sqrt{n}}) \\
&\approx \sum_{k=m_n}^{M_n} \int_{x_k - \frac{1}{2\sqrt{n}}}^{x_k + \frac{1}{2\sqrt{n}}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx \\
&= \int_{x_{m_n} - \frac{1}{2\sqrt{n}}}^{x_{M_n} + \frac{1}{2\sqrt{n}}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx \\
&\rightarrow \int_a^b \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx
\end{aligned}$$

Therefore, $\lim_{n \rightarrow \infty} \mathbb{P}(Y_n \leq x) = \int_{-\infty}^x \frac{1}{\sqrt{2\pi}} e^{-\frac{u^2}{2}} du$.

(3) Suppose Z_1, Z_2, \dots, Z_n , *I.I.D.*, are Poisson random variables with parameter 1. Then, $X_n = \sum_{k=1}^n Z_k \sim \text{Poisson}(n)$, and $\mathbb{E}(X_n) = n$, $\text{Var}(X_n) = n$. By Central Limit Theorem, $\frac{X_n - n}{\sqrt{n}} \xrightarrow{d} \mathcal{N}(0, 1)$.

4 Tightness

Problem 8

Let $\Lambda \subset \mathbb{R}$ be an interval and $\Sigma = \llbracket 1, N \rrbracket$ with $N \in \mathbb{N} \cup \{\infty\}$. Consider the maps

$$\pi_i : C(\Sigma \times \Lambda) \rightarrow C(\Lambda), \quad \pi_i(F)(x) = F(i, x), \quad i \in \Sigma.$$

Since $C(X)$ with the topology of compact convergence is metrizable by problem 1, to show that the π_i are continuous, it suffices to show that if $f_n \rightarrow f$ in $C(\Sigma \times \Lambda)$, then $\pi_i(f_n) \rightarrow \pi_i(f)$ in $C(\Lambda)$. But this is immediate, since if $f_n \rightarrow f$ uniformly on compact subsets of $\Sigma \times \Lambda$, then in particular $f_n(i, \cdot) \rightarrow f(i, \cdot)$ uniformly on compact subsets of Λ .

Let \mathcal{L}^n be a sequence of Σ -indexed line ensembles on Λ , i.e., each \mathcal{L}^n is a $C(\Sigma \times \Lambda)$ -valued random variable on a probability space $(\Omega, \mathcal{F}, \mathbb{P})$. Let $X_i^n := \pi_i(\mathcal{L}^n)$. If A is a Borel set in $C(\Lambda)$, then $(X_i^n)^{-1}(A) = (\mathcal{L}^n)^{-1}(\pi_i^{-1}(A))$. Note $\pi_i^{-1}(A) \in \mathcal{C}_\Sigma$ since π_i is continuous, so it follows that $(X_i^n)^{-1}(A) \in \mathcal{F}$. Thus X_i^n is a $C(\Lambda)$ -valued random variable.

Suppose the sequence (\mathcal{L}^n) is tight. Then (\mathcal{L}^n) is relatively compact, that is, every subsequence (\mathcal{L}^{n_k}) has a further subsequence $(\mathcal{L}^{n_{k_\ell}})$ converging weakly to some \mathcal{L} . Then for each $i \in \Sigma$, since π_i is continuous, the subsequence $(\pi_i(\mathcal{L}^{n_{k_\ell}}))$ of $(\pi_i(\mathcal{L}^{n_k}))$ converges weakly to $\pi_i(\mathcal{L})$ by the continuous mapping theorem. Thus every subsequence of $(\pi_i(\mathcal{L}^n))$ has a convergent subsequence. Since $C(\Lambda)$ is a Polish space by the argument in problem 1, Prohorov's theorem implies that each $(\pi_i(\mathcal{L}^n))$ is tight.

Conversely, suppose $(\pi_i(\mathcal{L}^n))$ is tight for all $i \in \Sigma$. Then for each i , every subsequence $(\pi_i(\mathcal{L}^{n_k}))$ has a further subsequence $(\pi_i(\mathcal{L}^{n_{k_\ell}}))$ converging weakly to some \mathcal{L}_i . By diagonalizing the subsequences (n_{k_ℓ}) , we obtain a sequence that works for all i , so that $\pi_i(\mathcal{L}^{n_{k_\ell}}) \implies \mathcal{L}_i$ for all i simultaneously. If Q^n is the law of \mathcal{L}^n as above and Q_i is the law of \mathcal{L}_i , we claim that $Q^{n_{k_\ell}}$ converges weakly to the product measure $Q_1 \otimes Q_2 \otimes \cdots$.

Since $C(\Sigma \times \Lambda)$ is homeomorphic to $\prod_{i \in \Sigma} C(\Lambda)$, we can identify the sequence of random variables $(\mathcal{L}_i)_{i \in \Sigma}$ with an element of $C(\Sigma \times \Lambda)$. Then $\mathcal{L}^{n_{k_\ell}} \implies (\mathcal{L}_i)_{i \in \Sigma}$.
